Glyoxylate Shunt of Aspartate the 1st Step

SYNTHESIS OF AMINO ACIDS:

Amino acid synthesis is the set of biochemical reactions, a reversible set of ways which the various amino acids are produced from other compounds.

- 1. **Reduction of N_2 to NH_4**
- 2. **Transamination**
- 3. **Synthesis of amino acids by reductive amination**

2. TRANSAMINATION:

- Transamination is the process by which amino groups are removed from amino acids and transferred to α -keto acids to generate the amino acid portion of the keto acid and the keto acid portion of the original amino acid.
- This is one of the major reactions in which the amino acids are converted to keto acids, which are then used for energy production.
- Transamination is a reversible reaction which is catalyzed by enzymes (transaminases or aminotransferases). α -Ketoglutarate acts as the predominant amino group acceptor and produces glutamate as the keto acid.
- Amino acids: α -ketoglutarate \rightleftharpoons keto acid + Glutamate

1. REDUCTION OF N_2 TO NH_4 :

- Nitrogen fixation is the process by which gaseous nitrogen (N_2) is converted to ammonia (NH_3 or NH_4^+) via biological fixation or nitrification through high energy physical processes.
- N_2 is a very stable molecule and a great deal of energy is required to break the bonds that join the two N atoms.

INTRODUCTION:

Amino acids/ Amino acids are organic compounds that contain amino and carboxyl functional groups, along with a side chain (R group) specific to each amino acid.

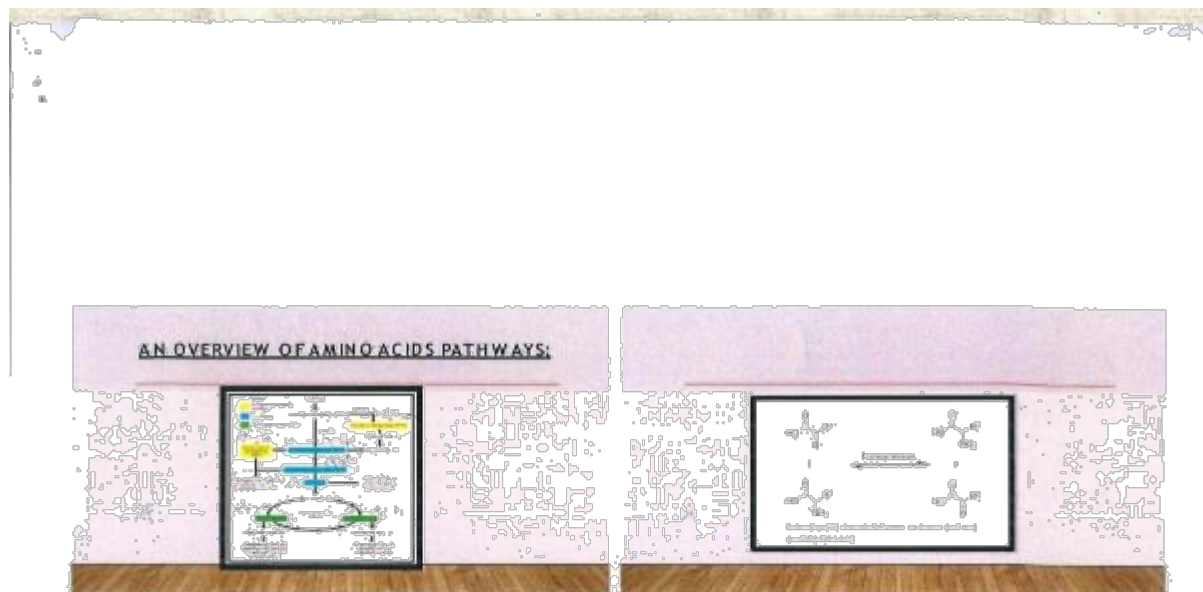

Amino acid synthesis is the set of biochemical processes (metabolic pathways) by which the amino acids are produced.

The substrates for these processes are various compounds in the organism's diet or synthesized internally. All organisms are able to synthesize all amino acids.

Enzymes are proteins that act as biological catalysts. Catalysts accelerate chemical reactions. The molecules upon which enzymes may act are called substrates, and the enzyme converts the substrates into different molecules known as products.

Enzymes are proteins that help speed up chemical reactions in our bodies. Enzymes are essential for digestion, liver function and much more. Too much or too little of a certain enzyme can cause health problems

Factors Affecting Enzymatic Activity

Rajust

Uses of Enzymes :

- Enzymes are used in digestion to break down large molecules into smaller molecules so they can be used for growth, respiration and other life processes

- Metabolism refers to all the chemical reactions in an organism. These reactions use energy and are catalysed by enzymes.
